## **Technical Information**

rheology modifier for solvent based systems general

> particularly finely ground additive used to impart a thixotropic effect to paints, printing inks and other coatings

sagging of thick films on vertical surfaces is effectively prevented while the working- and flow properties are also generally improved

pigment settling is substantially reduced

chemical nature hydrogenated castor oil

**Properties** 

physical form fine, white powder

Efka® RM 1920 should be stored in a cool dry place. storage

typical properties hydroxyl value ~ 155 mg KOH/g (no supply specification) solid content ~ 99%

 $5 - 9 \mu m$ ,  $99\% < 32 \mu m$ , particle size distribution

100% < 44 µm

# **Application**

Efka® RM 1920 can be used in most non-aqueous coatings both with and without solvents. The lower the polarity of the coating, the better is its performance.

Primers, fillers and top coats based on

- · chlorinated rubber
- alkyd resins
- epoxy resins
- unsaturated polyester
- acrylates
- polyurethane
- epoxy esters
- PVC and PVC copolymers
- polyethylene chloride
- bitumen

are the main fields of application. Its use in zinc rich primers is also recommended to prevent the zinc from settling and to ensure good brushability.

## recommended concentrations

optimum results are obtained if the following processing instructions are followed:

- **pre-gel:** preferably a pre-gel is prepared containing 10 20% Efka® RM 1920 in a solvent (e.g. xylene, toluene, other higher aromatic solvents, tetralin, white spirit, butylacetate, ethyl glycol acetate, styrene) or plasticizer (e.g. dibutyl phthalate), with or without addition of binders. The pre-gel may be prepared either warm or cold, e.g. in a dissolver. In zinc rich primers the thixotropic agent can be added in powder form since the shear forces during grinding are high enough to ensure good dispersion.
- **grinding with the pigments:** add the pre-gel to the mill base before grinding.
- **temperature limits:** Keep the grind temperature within the following limits: minimum 30°C, maximum 50 55°C in aliphatic and 40 °C in aromatic systems.
